

DAILY RECORDS OF THE SMART BOILER OPERATION

In this "Journal" it is necessary to keep records of the Smart Biomass Boiler operation in the particular days. Record the data of the Boiler pre-set temperature, actual outlet temperature / actual return temperature, flue gases temperature and actual output at least once a day or rather twice a day. In addition, it is necessary to record the information about the boiler shutdown; failures (record the date, time and the reason thereof, or defect). This information is important for the feedback information about the boiler operation for the Operator of the Boiler, as well as for the Service Department of the company SMART HEATING TECHNOLOGY.
